Why ROV? RPKI Deployment Status in Japan

JANOG 55 Sheryl (Shane) HERMOSO

What is RPKI?

Phase 1: ROA (Signing origin) Resource holders must create their ROA objects, which gets published to the RPKI repo

RPKI

robust security framework for verifying the association between resource holders and their Internet number resources

Phase 2: ROV (Validating origin) Routers are validating route entries against the RPKI cache

ROA is just the beginning. ROAs only serve their purpose if routes are validating.

What is contained in a ROA?

- ✓ The AS number you have authorized
- $\checkmark\,$ The prefix that is being originated from it
- ✓ The most specific prefix (maximum length) that the AS may announce

For example:

"ISP A permits AS65551 to originate a route for the prefix 198.51.100.0/24"

Who should create a ROA?

□ Resource holders

Phase 1 – Create ROAs

From APNIC (or NIR) portal:

ROA Configuration

Origin	ASN 131107	Prefix	2001:df2:e	e00::/48	Max Length	48
d Add &	clone Clear					
Sł	Show 10 • entries		Search: 131107			
(Origin ASN	Prefix 👫	Max Length	11	Certified	Resources
1	131107	202.125.96.0/24	24	Delete	61.45.248.0/21	
	101107	2001/4/2000/00/4/2	40		202.125.96.0/23	
'	131107	2001:012:000::/48	48	Delete	203.30.127.0/24	
	Showing 1 to 2 of 2 optring (filtered from 22 total optring)			Provious 1 No	2001:DF0:A::/48	
SF	howing 1 to 2 of 2 entries	(filtered from 22 total entries)		FIEVIUIS		
Sł	howing 1 to 2 of 2 entries	(filtered from 22 total entries)		Frevious I ivez	2001:DF2:EE00::/47	,

If you are a resource holder of an IP address block, create your ROAs now!

Phase 2 – Implement ROV

Configure router to get validated routes from an RPKI cache (RTR session)

 ✓ Router fetches ROA information from the validated RPKI cache (Crypto stripped by the validator)

✓ BGP checks each BGP update received against the ROA information and labels them accordingly

Router Sessions

This table shows all routers connected to this RPKI Validator. Requests and responses are described in RFC 6810. For debugging, please refer to rtr.log.

Remote Address	Connection Time	Last Request Time	Last Request	Last Reply
202.125.96.253:51107	2018-11-12T12:58:34+10:00	2018-11-12T13:55:24+10:00	ResetQuery	EndOfDataPdu

Setup your own RPKI validator

RPKI-aware router connects to the validator to fetch validated routes

RPKI Validators

- Many options to choose from:
 - Routinator
 - 。 Rpki-client
 - $_{\circ}$ Fort
 - o OctoRPKI/GoRTR
- More mature easier to install, better documentation
- Considerations:
 - o Which validator to use?
 - 。 Do I need multiple validators?
 - $_{\circ}\,$ What happens when RTR session fails?

Route Origin Validation (ROV)

There are 3 validation states:

Valid

The prefix (prefix length) and AS pair found in the database

Ex: This ROA is created

ASN	Prefix	Max Length
17862	203.176.189.0/22	23

Invalid

Prefix is found, but origin-AS is wrong, OR

The prefix length is longer than the maximum length

Not Found / Unknown Neither valid nor invalid (perhaps not created) With Origin Validation, these BGP routes will have an RPKI state as follows:

ASN	Prefix	RPKI State
17862	203.176.189.0/22	VALID
17862	203.176.189.0/23	VALID
17862	203.176.189.0/24	INVALID
17861	203.176.189.0/22	INVALID
17862	203.176.189.0/21	NOT FOUND

AS0 ROAs

- ROA with origin ASO instead of a real ASN
 - Routes will be RPKI-invalid when they would otherwise be RPKIunknown.
- Why use it?
 - Prevent unused delegations from being hijacked
 - Mitigate leakage of private-use public address space
- ASO will never appear as a functional origin in a ROA (see RFC7607)

Ex: For the following VRPs

7	ъ	D) c
V	Г	. P	2

2.0.0.0/16-16, ASO

3.0.0/22-24, ASO

4.0.0.0/24-24, ASO

4.0.0.0/24-24, AS1234

With Origin Validation, these BGP routes will have an RPKI state as follows:

ASN	Prefix	RPKI State
1234	1.0.0/24	NOT FOUND
1234	2.0.0.0/16	INVALID
1234	2.0.0.0/24	INVALID
1234	3.0.0.0/16	NOT FOUND
1234	4.0.0.0/24	VALID

Route Origin Validation (ROV)

Phase 2 – ROV Filtering

Tag

If you have downstream customers or run a route server (IXP)

[Valid (ASN:65XX0),
Not Found (ASN:65XX1),
Invalid (ASN:65XX2)]

Modify preference values – RFC7115

[Valid > Not Found > Invalid]

Drop Invalids

Many providers are already dropping invalid routes.

Is BGP safe yet? No.

Border Gateway Protocol (BGP) is the postal service of the Internet. It's responsible for looking at all of the available paths that data could travel and picking the best route.

Unfortunately, it isn't secure, and there have been some major Internet disruptions as a result. But fortunately there is a way to make it secure.

ISPs and other major Internet players (Sprint and others) would need to implement a certification system, called RPKI.

Test your ISP Read FAQ

FAILURE

Your ISP (Eastern Telecommunications Philippines Inc., AS9658) does not implement BGP safely. It should be using RPKI to protect the Internet from BGP hijacks. Tweet this \rightarrow
